

High-Efficiency, Step-Up DC/DC Controller

FEATURES

- 4V to 20V Input Voltage Operation.
- Adjustable Output Voltage.
- Low Quiescent Current at 100 μ A.
- Pulse-Skipping and Pulse-Frequency Modulation Maintain High Efficiency (max. 95%).
- 90KHz to 250KHz Oscillator Frequency.
- Power-Saving Shutdown Mode (8 μ A Typical).
- Push-Pull Driver Output.
- V_{REF} Pin Available.
- Current Limit Function Available.

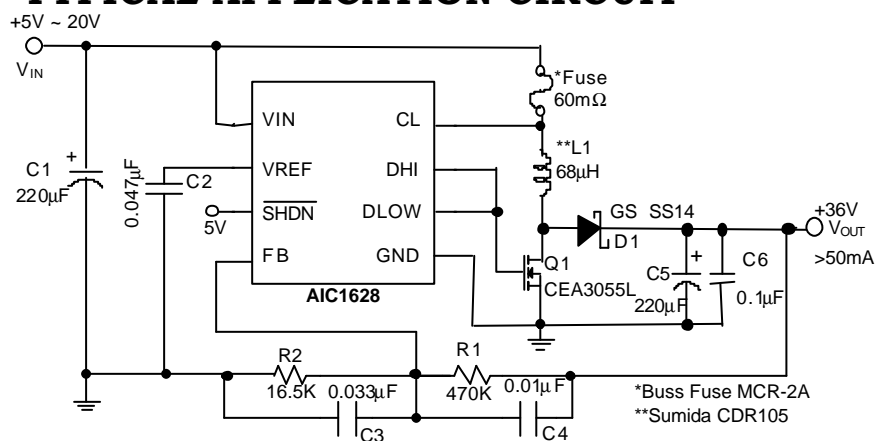

APPLICATIONS

- Flash Memory Programming Power Supply.
- Positive LCD Contrast Bias for Notebook & Palmtop Computers.
- Step-Up DC/DC Converter Module.
- Telecom Power Supply.

DESCRIPTION

The AIC1628 is a high performance step-up DC/DC controller, designed to drive an external power switch to generate programmable positive voltages. In the particularly suitable LCD contrast bias and flash memory programming power supply applications, typical full-load efficiencies are 85% to 95%. 4V to 20V input operation range allows the AIC1628 to be powered directly by the battery pack in the most battery-operated applications for greater efficiency. Output voltage can be scaled to 40V or greater by two external resistors. A Pulse-Frequency Modulation scheme is employed to maintain high efficiency conversion under wide input voltage range. Quiescent current is about 100 μ A and can be reduced to 8 μ A in shutdown mode. Switching frequency being around 90KHz to 250KHz range, small size switching components are ideal for battery powered portable equipments, like notebook and palmtop computers.

■ PIN DESCRIPTIONS

PIN 1: VIN - Input supply voltage is from 4V to 20V.

PIN 2: VREF - Reference output is 1.22V. Bypass with a 0.047μF capacitor to GND. Sourcing capability is guaranteed to be greater than 250μA.

PIN 3: $\overline{\text{SHDN}}$ - Logical input to shutdown the chip.
 >1.5V = normal operation,
 GND = Shutdown,
 Can not be floating or forced greater than 15V. In shutdown mode DLOW and DHI pins are at low level.

PIN 4: FB - Feedback signal input to sense VREF. Connecting a resistor R1 to V_{OUT} and a resistor R2 to GND yields the output voltage:

$$V_{\text{OUT}} = (R1+R2)/R2 \times V_{\text{REF}}$$

(Refer to typical application circuit)

PIN 5: GND - Power ground.

PIN 6: DLOW - Connected to gate of the external N-channel MOSFET or base of the NPN bipolar transistor.

PIN 7: DHI - Driver sourcing output. Connected to DLOW when using an external N-channel MOSFET. When using an external NPN bipolar transistor, connect a base resistor RB from this pin to DLOW. RB value depends on VIN, inductor and NPN current gain.

PIN 8: CL - Current-limit input. Threshold voltage is 60mV from VIN. This pin clamps the switch peak current to prevent over-current damage to the external switch, under abnormal conditions.
