

LOW NOISE 150mA LDO REGULATOR

NO. EA-130-0512

OUTLINE

The R1126N Series are CMOS-based voltage regulator ICs with high output voltage accuracy, low supply current, low on Resistance, and high ripple rejection. Each of these ICs consists of a voltage reference unit, an error amplifier, resistor-net for voltage setting, a short current limit circuit, a chip enable circuit, and so on.

These ICs perform with low dropout voltage and the chip-enable function. The supply current at no load of this IC is only 10 μ A, and the line transient response and the load transient response of the R1126N Series are excellent, thus these ICs are very suitable for the power supply for hand-held communication equipment.

The supply current at no load of R1126x Series is remarkably reduced compared with R1114x Series. The mode change signal to reduce the supply current is not necessary. The output voltage accuracy is also improved ($\pm 1.5\%$)

The output voltage of these ICs is fixed with high accuracy. Since the package for these ICs is SOT-23-5 therefore high density mounting of the ICs on boards is possible.

R1116N Series that a pin configuration differs from R1126N Series are available.

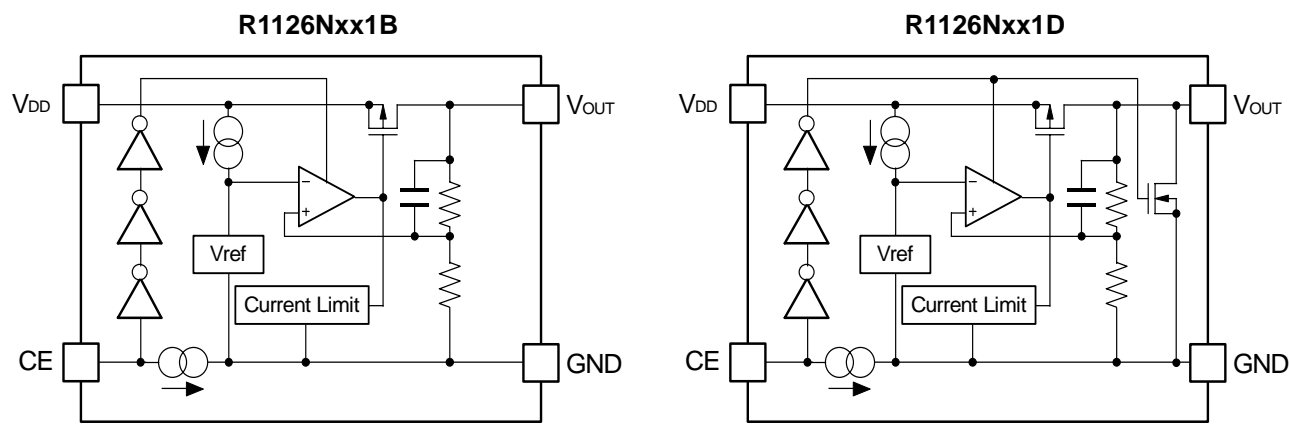

FEATURES

- Low Supply Current Typ. 10 μ A
- Standby Current Typ. 0.1 μ A
- Input Voltage Range 1.8V to 6.0V
- Output Voltage Range 1.5V to 4.0V
- Low Dropout Voltage Typ. 0.29V ($I_{OUT}=150\text{mA}$, $V_{OUT}=2.8\text{V}$)
- High Ripple Rejection Typ. 70dB ($f=1\text{kHz}$, $V_{OUT}=3.0\text{V}$)
Typ. 53dB ($f=10\text{kHz}$)
- High Output Voltage Accuracy $\pm 1.5\%$ ($1.5\text{V} \leq V_{OUT} \leq 3.0\text{V}$), $\pm 2.0\%$ ($V_{OUT} > 3.0\text{V}$)
- Low Temperature-Drift Coefficient of Output Voltage Typ. $\pm 100\text{ppm}/^\circ\text{C}$
- Excellent Line Regulation Typ. 0.02%/V
- Small Packages SOT-23-5
- Built-in Fold Back Protection Circuit Typ. 40mA (Current at short mode)
- Ceramic capacitors are recommended to be used with this IC ... $C_{IN}=C_{OUT}=1.0\mu\text{F}$ (Ceramic)

APPLICATIONS

- Power source for portable communication equipment.
- Power source for portable music player.
- Power source for electrical appliances such as cameras, VCRs and camcorders.
- Power source for battery-powered equipment.

SELECTION GUIDE

The output voltage, version, and the taping type for the ICs can be selected at the user's request.
The selection can be made with designating the part number as shown below;

R1126Nxx1x-xx ←Part Number
 ↑ ↑ ↑ ↑
 a b c d

Code	Contents
a	Designation of Package Type: N: SOT-23-5
b	Setting Output Voltage (V _{OUT}): Stepwise setting with a step of 0.1V in the range of 1.5V to 4.0V is possible. Exceptions:2.85V=R1126N281x5, 1.85V=R1126N181x5
c	Designation of Active Type: B: active high type D: active high, with auto discharge
d	Designation of Taping Type: Ex. TR (refer to Taping Specifications; TR type is the standard direction.)

C₁ Ceramic 1.0μF

When using these ICs, consider the following points:

1. Mounting on PCB

Make V_{DD} and GND lines sufficient. If their impedance is high, noise pickup or unstable operation may result. Connect a capacitor with a capacitance value as much as 1.0μF or more as C₁ between V_{DD} and GND pin, and as close as possible to the pins.

Set external components, especially the output capacitor, as close as possible to the ICs, and make wiring as short as possible.

2. Phase Compensation

In these ICs, phase compensation is made for securing stable operation even if the load current is varied. For this purpose, use a capacitor C₂ with good frequency characteristics and ESR (Equivalent Series Resistance). (Note: If additional ceramic capacitors are connected with parallel to the output pin with an output capacitor for phase compensation, the operation might be unstable. Because of this, test these ICs with as same external components as ones to be used on the PCB.)

If you use a tantalum type capacitor and ESR value of the capacitor is large, output might be unstable. Evaluate your circuit with considering frequency characteristics.

Depending on the capacitor size, manufacturer, and part number, the bias characteristics and temperature characteristics are different. Evaluate the circuit with actual using capacitors.

ESR vs. Output Current

When using these ICs, consider the following points:

The relations between I_{OUT} (Output Current) and ESR of an output capacitor are shown below.

The conditions when the white noise level is under $40\mu V$ (Avg.) are marked as the hatched area in the graph.
